                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a fragment complementation system (I) CC which comprises a first oligopeptide (OP1) containing an N-terminal CC fragment with a C-terminal break point and a second oligopeptide (OP2) CC comprising a C-terminal with a N-terminal breakpoint, in which the C and CC reassemble to form a functionally reconstituted MP. Methods from the CC protein interactions in a sample, identifying oligopeptide interactions for memoraphous that brind to an extracellular domain of a transmembrane protein and a polypeptide, for complicated signal transducers, forming a protein and a polypeptide, for complated signal transducers, forming a enzyme complementation system for selecting simultaneous incorporation of multiple genetic elements into a flost the lost cell and for activating a beta-lactam derivative of an antitumour CC compound in a host who is in need of it. The present sequence represents CC exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

CC terminal fragment each are derived from a marker protein and reassemble Ct to form a functionally reconstituted marker protein and reassemble Ct to form a functionally reconstituted marker protein. (I) is useful for CC selecting simultaneous incorporation of multiple genetic elements into a CC to host cell, and activating a beta-lactam derivative of an anti-tumour CC compound in a host. The method described is useful for identifying a CC second oligopeptide to which a first oligopeptide binds, involving co-CC expressing the first and second oligopeptides. Binding of the first CC oligopeptide to the second oligopeptide results in the functional CC reassembly of the marker protein. The method is also useful for CC dentifying oligopeptide interactions between two different proteemes; CC and identifying epitopes that bind to an immunoglobulin variable region. CC (I) or an expression casette (II), encoding a selectable N or C-terminal peptide, is useful for identifying interactions between an extra cellular CC domain of a transmembrane protein and a polypeptide, where the CC (II) is useful for high-throughput identification of compound that CC inhibit phosphorylation-regulated cell signal transducers. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a fragment complementation system (I) comprising a first oligopeptide having an N-cerminal fragment with a C-terminal break-point, and a second oligopeptide having a C-terminal fragment with a N-terminal break-point, where the N-terminal fragment and the C-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fragment complementation system for detecting immunoglobulin epitope, has first oligopeptide containing N-terminal fragment with C-terminal break-point, second oligopeptide containing C-terminal fragment with N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 2; 47pp; English
